

Disaster prevention / safety laminated glass

"Disaster prevention / safety laminated glass" is glass that is completely adhered by sandwiching a flexible and durable special synthetic resin interlayer film between two or more pieces of glass. Since the two pieces of glass are firmly adhered, flying objects such as roof tiles will not penetrate the window glass even if they are hit by a storm such as a typhoon. It also protects the resident's body and household items, as debris does not easily scatter even if damaged. In addition, because the glass does not easily fall off the window frame, it is more likely that you will be able to maintain your life even after a disaster. "Disaster prevention / safety laminated glass" has the same safety against collision of flying objects as the attack body level C specified in JIS R 3109.
